

Press release, August 2026

Where print productivity meets ambition

swissQprint will be presenting its Generation 5 flatbed printers at Sign2Com in Kortrijk, Belgium, from 4 to 6 October 2026 (hall 2, stand 4150), demonstrating how print businesses can increase throughput, expand their application portfolio and rely on consistent production day after day.

Time pressure is a given in print production. What sets a machine apart is how reliably it performs when the pressure is on. swissQprint's Generation 5 flatbeds are engineered to keep pace with the most demanding production schedules. They deliver consistent output quality across long and short runs – and hold that standard even under the tightest turnarounds. At Sign2Com, live demonstrations at stand 4150 will show how this translates into everyday production.

High-margin applications

Varnish printing, neon inks, haptic finishes and colour-changing effects are not gimmicks. They enable print businesses to differentiate themselves, create premium products and open new revenue opportunities. swissQprint's Generation 5 makes them accessible and production-ready. A broad selection of print samples and displays at the stand will show what is possible and how these applications can help increase profitability.

Scalable solutions for every operation

"Every print service provider has different priorities," says Wim Vandendriessche, Managing Director of swissQprint Benelux. "Whether the focus is higher throughput, greater application versatility or dependable day to day production, the right technology should support business growth. That's exactly what Generation 5 is designed to do."

The Generation 5 range scales to suit a wide spectrum of operations, from high-volume facilities to specialist shops. Each machine is backed by a 36-month factory warranty, underlining the manufacturer's confidence in the long-term reliability of its systems. Throughout the show, swissQprint specialists will be on hand for live demonstrations and personal advice on how to maximise productivity and application potential.
